Education & Summary

University of Wollongong in Dubai – Expected 2027

Computer and Autonomous Systems Engineering student at University of Wollongong in Dubai with hands-on experience building ML pipelines, LLM-powered developer tools, and predictive models in production fintech and aviation environments.

Skills

Languages: Python, TypeScript, C, SQL

Backend: Node.js, Express.js, REST APIs

Frontend: React, Next.js

Infrastructure & Tools: Docker, Kubernetes, PostgreSQL

AI/ML: LLM APIs (prompt engineering, RAG), OpenCV, scikit-learn, Pandas, NumPy, Matplotlib

Experience

AI Engineering Intern | Baraka Financial Ltd., Dubai (Feb 2026 – Present)

- Deployed containerized services to Kubernetes; built AI-powered internal tooling that automated error classification and log analysis, eliminating manual triage across support workflows.
- Built Position Search and Trading Account Monitor modules integrating OMS, Instruments, and Wallet microservices, reducing manual portfolio lookup time for operations teams.
- Unified inconsistent data schemas across distributed services into a single portfolio state model, eliminating data discrepancies in cross-market account views.

Digital Intern | IndiGo InterGlobe Aviation Ltd., Gurgaon (August 2025 – Sept 2025) – [GitHub](#)

- Built a Logistic Regression model to predict on-time arrival performance on the DEL-BOM sector using 1,000 flight records and 6 engineered features (block-hour overrun, departure delay, aircraft type, weather index, ATC congestion), achieving 88% accuracy with balanced precision/recall across both classes.
- Engineered features from raw operational data including one-hot encoding of 3 aircraft types (A320, A320neo, A321neo), computed block-hour overrun from scheduled vs. actual hours, and conducted correlation analysis across 10 numerical variables to inform feature selection for modeling.

Software Engineering Intern | Lab of Future, Dubai (Jun 2025- Aug 2025)

- Built internal educational software used by 500+ students across 4 campuses.
-

Projects

ExamForge - [GitHub](#), [Website Link](#)

- Built a full-stack AI-powered exam generation platform using LLM APIs for dynamic multi-format question creation.
- Designed interactive workflows allowing students to generate, attempt, and review customized assessments.

F1 Simulation Dashboard - [GitHub](#)

- Built a full-stack race simulation engine modeling tire degradation, pit strategy, safety cars, weather, and overtaking across all 24 2026 GPs using Monte Carlo probability methods.
- Implemented dual-mode interface: season-wide predictions and fully configurable custom race simulations. -

Spotify Song Analyzer - [GitHub](#)

- Built a Spotify data analysis pipeline to extract and analyze audio features (tempo, energy, danceability) using Python.
- Identified key correlations in music attributes through exploratory analysis and feature engineering.

Orvyn ExoArm – Rehabilitation Exoskeleton (Current – May 2026)

- Developing signal classification pipeline to differentiate between intended finger movements and noise, targeting 90%+ accuracy for assisted rehab exercises.
- Designing a microcontroller-based rehabilitation exoskeleton that interprets sEMG signals to assist finger movement through real-time signal processing and controlled servo actuation.

MedAir Autonomous Delivery Aircraft

- Designed a hybrid autonomous aircraft for emergency medical delivery with embedded flight control logic and mission-based transition systems. Awarded Platinum and Gold at Dubai University Innovation Fair.
